Meteosat Third Generation (MTG): Mission overview

■ Imagery missions (MTG-I):

1. Full disk imagery every 10 minutes in 16 spectral bands with the Flexible Combined Imager (FCI). Fast imaging of European weather every 2.5 minutes
2. Day/night Lightning Imager (LI)

■ Sounding mission (MTG-S):

1. 3D mapping of water vapour, temperature with Hyperspectral Infrared Sounder (IRS)
2. Air quality monitoring and atmospheric chemistry in synergy with Sentinel-4 / Ultraviolet Visible & Near-infrared

■ **Start of operations in 2022 and 2024**

■ **Operational exploitation: 2022–2042**

- The FCI imager is one of the two main payloads onboard the Meteosat Third Generation Imaging (MTG-I) satellites, together with the Lightning Imager (LI).

- First FCI on MTG-I1: **full disk scanning service (FDSS)** with **10min** temporal resolution.
- Second FCI on MTG-I2: **rapid scanning service (RSS)** over Europe with **2.5min** temporal resolution.

The entire fire cycle can be observed by FCI with unprecedented temporal detail!

- 8 channels in the thermal IR domain (3.8 μ m - 13.3 μ m), 2km spatial resolution at nadir (FDHSI).
- 8 channels in the solar VIS-NIR domain (0.4 μ m - 2.2 μ m), 1km spatial resolution at nadir (FDHSI).
- 4 channels are also available at higher spatial resolution (HRFI):
 - IR3.8 and IR10.5: 1km (nadir)
 - VIS0.6 and NIR2.2: 0.5km (nadir)

No.	Central λ / μ m	λ width / μ m	Resolution / km	No.	Central λ / μ m	λ width / μ m	Resolution / km
1	0.44	0.06	1.0	9	3.80 	0.40	2.0/1.0
2	0.51	0.04	1.0	10	6.30	1.00	2.0
3	0.64	0.05	1.0/0.5	11	7.35	0.50	2.0

8	2.25 	0.05	1.0/0.5	16	13.30	0.60	2.0

2 km 1 km 0.5 km

Fires and hotspots can be observed by FCI with unprecedented spatial detail!

- Most sensitive channel for (sub-pixel) wildfires
- Particular efforts during the instrument design to maximise detection performance (two separate detector arrays to cover larger dynamic range)
- Main Improvements on FCI compared to SEVIRI:
 - Better spatial resolution -> **from 3km to 1km** (9 times more pixels!)
 - Higher saturation brightness temperature -> **from ~335K to ~490K** (TBC)
 - Less CO₂ absorption and limb cooling -> **from 3.9 μ m to 3.8 μ m** central wavelength
 - Higher radiometric resolution -> **from 10 bits to 13 bits**
 - No “blinding” effect -> **from spinning to 3-axis stabilised platform**

Warning Advisory and Assessment System

Met Office

- Continuous support to CAMS for reanalysis campaigns & assimilation preparation (in addition to: NRT SYnergy PMAP, FCI, 3MI, NRT SYnergy MAP);
- Collaboration with NASA + NOAA for smoke prediction and transition from MODIS Terra to NRT Sentinel-3;
- 1st testing of NRT FRP with CEMS, NILU (vegetation fires, industrial gas flare).

CAMS Total Fire Carbon Emissions (GFASv1.2) for Canada

GFASv1.2 Total Fire Radiative Power: 2023-08-01 - 2023-08-31

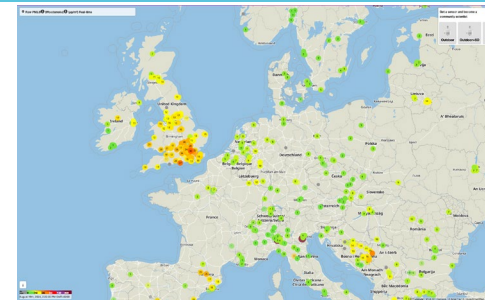

GFASv1.2 Total Fire Radiative Power: 2024-08-01 - 2024-08-31

EUROPEAN COMMISSION Copernicus ECMWF

- 2024 is the second most extreme wildfire year for Canada after 2023 in terms of emissions.
- Western provinces/territories have all experience at least one month with highest emissions for that month in the summer.
 - NWT fires contributed the most as in 2023.
- Significant long-range transport episode reached Europe resulting in measured surface PM2.5 and AOD enhancements.

1-30 Sep 2024. 00Z, T+3 to 24. VerOD 12.6.17.

Comparison of model (oper) and L1.5 Aeronet AOT at 500nm over
CUIABA-MIRANDA (15.73°S, 56.07°W).
1-30 Sep 2024. 00Z, T+3 to 24. VerOD 12.6.17.

- 2024 is the most extreme fire year for Bolivia, Amazonas and Mato Grosso do Sul in terms of emissions.
- Increased number and intensity of fires resulting in relatively persistent high AOD values (> 4) in both CAMS forecasts and Aeronet measurements.
- Significant long-range transport episode reached Europe resulting in measured surface PM_{2.5} and AOD enhancements.

- Story #1 – global impact of “exceptional” wildfire season on atmospheric carbon and aerosol – emissions coherent with observed concentrations
 - air quality to be evaluated – CAMS and ground-based stations
- Story #2 – observations part of a chain to evaluate and monitor fires in different phases – warning / near-real-time / impacts – growth in the upcoming years thanks to the observational effort (Copernicus)
 - Integrate data in forecast / emission systems
 - Support the uptake by services and value-adders in various phases
 - Ease access and usability
